

ABSTRACT OF THE DISCLOSURE

To provide a packet transmitter and a method for executing packet transmission fluently when a node having destination
5 converging exists, a packet transmitter includes a destination storing unit for storing a packet to be transmitted separately in respective destination in sequence; a transmitting unit for transmitting the packet, which is stored
10 separately in respective destination, separately in a destination sequence; and a control unit for stopping packet transmission for a predetermined period of time to the destination to which the packet transmission by the transmitting unit is failed.
